EXPERIENCE

Senior iOS Developer, Eulerity, New York *Feb 2023 to Present*

- Lead a team of 5 to 6 iOS engineers. I set technical direction, review code, and own delivery for the app.
- Work across the stack: iOS in Swift, Android in Kotlin and Jetpack Compose, web in React, and backend services in Java.
- Work with product and engineering leadership to scope new features, check technical feasibility, and plan delivery before the team commits. Also help hire mobile engineers by sourcing and interviewing candidates.
- Led the move to SwiftUI, which now covers about 70% of the codebase. It made iOS approachable enough that Android engineers started shipping iOS features themselves.
- Built four features across iOS, Android, and the backend, including the APIs behind them: an activity delta banner, live pulse indicators, a guided app tour, and pull-to-refresh with freshness timestamps. All shipped behind feature flags with parity on both platforms.
- Built a real-time data sync layer with Swift Concurrency and Combine. Responsiveness improved 30% and data-related issues dropped 20%.
- Introduced MVVM across the app, which raised team productivity by about 20%.
- Moved dependencies from CocoaPods to Swift Package Manager and cut build times by 25%.
- Own App Store releases end to end via App Store Connect and TestFlight, with XCTest automated in Jenkins as a release gate.
- Wrote the team's code review standard (concurrency, SwiftUI state, memory, testing) and enforce it in reviews.
- Built Claude Code skills for experiment removal, code review, PR drafting, and onboarding. The whole mobile team uses them, and some are now used across engineering. Also built an AI-assisted PR review flow tied into Jira and Figma that cut review time from about a week to under a day.
- Built a hackathon evaluation pipeline that pulls submissions from Gmail, scores them, and produces a results report. We reviewed hundreds of entries in a day instead of several weeks.

iOS Developer Intern, Eulerity, New York *May 2022 to Dec 2022*

- Brought in the KIF framework for combined UI and unit testing, improving testing efficiency by 50%.
- Tracked down a critical memory leak that was crashing older devices, which improved performance by 15%.
- Fixed bugs across the app and wrote internal docs for new features.

Software Engineer, Schnell Technologies, India *Dec 2019 to Aug 2021*

- Built websites, web apps, and mobile apps on a cross-functional team.
- Introduced a cloud database setup that cut data-analysis testing time by 60% and tightened data security.

iOS Developer Intern, Seva Tech, India *May 2019 to Jul 2019*

- Led a team of 6 building Rojgaar, an iOS app in Swift with Firebase for real-time connectivity.

PROJECTS

- **ChoreQuest (iOS):** A SwiftUI app that gamifies family chores. Parents create quests and approve completed work, kids track rewards on their own dashboard, and family profiles are backed by Firebase.
- **RestSync (macOS):** A SwiftUI menu-bar app built on the 20-20-20 rule to prompt regular screen breaks. Follows Apple's HIG, in daily use, with an App Store release planned.
- **CompanionKit (Xcode extension):** Built with Swift and XcodeKit, it uses the OpenAI API to refactor, find bugs, and explain selected code inside Xcode.

EDUCATION

M.S. Artificial Intelligence, New England College, NH *Jan 2026 to Present*
M.S. Computer Science, Stevens Institute of Technology, NJ *Aug 2021 to May 2023*

SKILLS

Languages: Swift, Kotlin, Java, Objective-C, Python, C++, JavaScript, SQL
Frameworks: SwiftUI, UIKit, Swift Concurrency, Combine, React, Core Data, HealthKit
Testing and delivery: XCTest, Swift Testing, KIF, Jenkins, App Store Connect, TestFlight, Swift Package Manager
Cloud and tools: Firebase, AWS, Docker, Figma
Practices: Feature scoping, technical feasibility, cross-platform delivery, code review, mentoring
AI tooling: Claude Code, Claude Cowork, MCP, GitHub Copilot, ChatGPT Codex, RAG
